

Project Plan & Scope

Proposed plan for review • Modeled on lightlaunch.ai

1. Project Overview

This plan outlines a lead-generation web application for Festive Lighting Pros, modeled on the functionality of lightlaunch.ai. The product lets a homeowner see a photorealistic preview of their own house decorated with permanent holiday and landscape lighting, then instantly receive a priced quote. Every render creates a private, shareable customer quote page (with QR code) and captures the homeowner as a lead inside a contractor dashboard.

The goal is to turn "I might be interested" into a booked consultation by giving prospects an instant, personalized visual and price — and to give the sales team a single place to manage those leads through to a closed job.

2. Functional Scope

- **Branded landing page** Marketing site matching Festive Lighting Pros branding (logo, colors, phone), with the look and feel of Light Launch.
- **Photo render widget** Homeowner uploads a photo of their house (or enters an address); the system returns the same house with permanent lighting traced along the roofline.
- **Instant pricing** Auto-estimated front-of-house and whole-house pricing based on measured or entered footage.
- **Customer quote pages** Each render generates a private page (image, price, call-to-action) reachable by unique URL and QR code.
- **Lead capture** Every render or quote request is stored as a lead with contact info and source.
- **Contractor dashboard** Logged-in area: Overview, Leads, Outreach, Campaigns, Quotes, Jobs, Schedule, Templates, Customer Portal, Settings, Billing.
- **Campaigns** Group target homes into a campaign and track each home through a pipeline (Prospect > Rendered > Quote sent > Viewed > Interested > Closed) with live pipeline value.
- **Authentication** Secure user accounts for the contractor team.
- **Database** Persistent storage for leads, renders, campaigns, and campaign homes.

3. Delivery Phases

- **Phase 1 — Foundation** Branded landing page, photo render widget, instant pricing, customer quote pages, lead capture, and database.
- **Phase 2 — Contractor Dashboard** Authentication, Overview, Leads, Campaigns pipeline, Quotes, and Customer Portal.
- **Phase 3 — Render Quality** Upgrade to a premium image model for exact, non-distorting roofline lighting that matches Light Launch quality. Requires a paid API.
- **Phase 4 — Address Automation** Address autocomplete and automatic Street View pull, so homeowners do not need to upload a photo (Google Maps Platform).
- **Phase 5 — Conversion & Payments** Automated call requests, deposit and payment collection (Stripe), and email/SMS notifications to the team.
- **Phase 6 — Operations** Jobs, Schedule, Templates, Settings, and Billing fully wired, plus reporting and export.

- **Phase 7 — Physical Direct Mail (Optional)** Auto-generate a personalized postcard (render, price, QR) for every home in a campaign and mail it via a print/mail API (Lob) — the Light Launch mailed-postcard model. Adds per-piece print and postage cost.

4. Technology Stack

- **Frontend** React (Vite) with React Router for the contractor dashboard, and a static marketing site.
- **Backend** Node.js and Express API (rendering, leads, campaigns, authentication).
- **Database & Auth** Supabase (Postgres + Auth).
- **Image rendering** Free option: Cloudflare Workers image generation. Recommended: Google Gemini image model for premium quality.
- **Maps** Free option: OpenStreetMap autocomplete. Optional: Google Maps Platform for address automation.

5. Paid Tools & Estimated Monthly Cost

Two paths are available. A free path keeps API cost near zero. A paid path is recommended for render quality and automation that match lightlaunch.ai. The cost table below covers only usage-based paid APIs (Gemini + Google Maps). All figures are estimates for budgeting only and will vary with usage.

Free path:

- **Cloudflare Workers image generation** Free image generation. Limitation: can slightly alter the house and lighting is less precise.
- **OpenStreetMap autocomplete** Free address suggestions. Homeowner uploads a photo (no auto Street View).

Paid path (recommended tools):

- **Google Gemini (image model)** Photorealistic, non-distorting edits. ~\$0.04 per render.
- **Google Maps Platform** Places Autocomplete + Street View + Geocoding. ~\$0.01–0.02 per render.
- **Lob direct mail (optional)** Print + mail personalized postcards. Pay per piece: ~\$0.70–\$1.50 each (print + postage). Only if physical mail is wanted.

Estimated monthly API cost by render volume (paid path — Gemini + Google Maps only):

Renders / month	Gemini (~\$0.04/render)	Google Maps (~\$0.01–0.02/render)	Estimated total
50	~\$2	~\$0.50–1	~\$2.50–3
100	~\$4	~\$1–2	~\$5–6
200	~\$8	~\$2–4	~\$10–12
500	~\$20	~\$5–10	~\$25–30
1,000	~\$40	~\$10–20	~\$50–60

Note: Costs above cover only the paid Gemini and Google Maps, and image costs scale per use — Lob adds per-transaction fees only if enabled in the dashboard and is separate from the totals above.

6. Decisions Needed From Reviewer

- **Render quality** Approve budget for the paid image model (Gemini) to match Light Launch quality, or stay on the free model?

- **Address automation** Use address-to-Street-View (paid Maps), or keep homeowner photo upload (free)?
- **Payments** Should the customer quote page collect a deposit (Stripe) in Phase 5?
- **Direct mail** Do we want physical mailed postcards (Lob, Phase 7) like Light Launch, or stay digital-only?
- **Notifications** Email/SMS alerts to the sales team on new leads — in scope?
- **Volume** Expected renders per month, to size the plan and budget accurately.
- **Scope changes** Any features to add or remove from Sections 2 and 3.
